

Configuration options

Controlling the output and functionality through configuration settings

Site variables

Default settings for site:

```
site:
  name: WDocs
  description: Documentation theme for wmk
  author: Baldur Kristinsson
  leading_path: ''
  base_url: ''
  repo_url: 'https://github.com/bk/wdocs-theme/'
  repo_name: WDocs on Github
  avec_theme: default
  tags_in_nav: true
  no_sitemap: false
  highlightjs: false
  hljs_style: github
  hljs_languages: []
  fontawesome: false
  auto_title_h1: false
  copyright: |
    Created with the <a href="https://github.com/bk/wdocs-theme">WDocs</a>
    documentation theme for <a href="https://wmk.baldr.net/">wmk</a>.
  tagline: 'Simple and easy documentation'
  extra_css: []
  extra_javascript: []
  navigation_depth: 2
  favicon: 'img/favicon.ico'
  lang: 'en'
```

- **name, description, author:** Mostly self-explanatory. By default, the **name** appears at the top right corner of the site and links to the homepage. It should therefore preferably be short.
- **leading_path, base_url:** Leading path is the path from the root of the subdomain on which the site is hosted to the directory containing the files generated by **wmk**. The **base_url**, if specified,

should contain both a protocol and hostname and also include the `leading_path`, if any, e.g. `https://example.com/mydocs/`. These variables are used by the `url` template filter, which adds the appropriate prefixes to those path fragments that do not start with `/`.

- `repo_url`, `repo_name`: If specified, a link to the given repository will be added to the footer of the page.
- `avec_theme`: The name of the `avec` color scheme. The themes available are: `default`, `one`, `gruvbox`, `pico`, `plain`, or `selenized`. All color schemes support both light and dark mode and adjust automatically to the user's light/dark preference.
- `tags_in_nav`: If true, a link to the Tags page will be placed in the site navigation.
- `no_sitemap`: If true, no sitemap page will be generated. The default is false.
- `highlightjs`, `hljs_style`, `hljs_languages`: Settings for the `highlight.js` Javascript module. If you use server-side syntax highlighting via `pygments` or `pandoc`, you will have to add CSS files yourself; the `highlightjs` configuration option is supplied as an easy alternative to this. It is, however, turned off by default.
- `fontawesome`: Whether to enable loading FontAwesome icon fonts. False by default. If enabled, FontAwesome symbols are used in the site navigation, which changes the appearance slightly.
- `auto_title_h1`: If true, then pages which do not start with a `<h1>` heading but have a `title` in the frontmatter are prefixed with the title as a `<h1>` heading. It will be followed by a `subtitle`, if any.
- `copyright`, `tagline`: These appear in the site footer.
- `extra_css`, `extra_javascript`, `favicon`: These are self-explanatory.
- `navigation_depth`: Which heading level to stop at in the table of contents that will be placed in the sidebar on each page.
- `lang`: Localization setting. Currently the supported languages are `en`, `da` and `is`. You can supply your own translation as a `wmk.mo` file that must be placed in `data/locales/<lang>/LC_MESSAGES/` in your project directory.

Nav setting

`nav`:

- Home: `/`
- Usage:
 - Getting started: `usage/getting-started`
 - Advanced settings: `usage/advanced`
- About:
 - Impressum: `about/impressum`
 - License: `about/license`

- Help: [about/help](#)
- Resources:
 - Code repository: <https://github.com/example/repo/>
 - Forum: <https://example.discourse.group/>

The `nav` setting has the structure shown in the example. It is presented by the WDocs theme as a navigation tree for the site, i.e. as a hierarchical navigation menu in the header bar (in desktop browsers) and in a “hamburger” menu (in mobile and tablet browsers). It also forms the basis of the Next and Previous links that are available on those pages that are in the `nav` structure.

Other settings

WDocs also supplies theme settings for `lunr_index`, `markdown_extensions`, and `markdown_extension_configs`. Most notably it turns site search on by default. These standard settings described in the `wmk` documentation.
